

## Rapid App Development

Many organisations want to build their own enterprise ready apps. This can take a number of highly skilled developers and a large amount of time to produce. If that same app is required on multiple mobile device platforms, costs can increase exponentially. Due to the lack of sufficient resource and duplication of effort, the scope of mobile projects often blows out and exceeds budget expectations.

The TOKN tool set includes standard app building frameworks, tools and plugins allowing you to create your own intuitive applications, significantly reducing app development time and saving you money.

1

### Standard development framework

The TOKN application development platform allows you to build new applications in the shortest possible time. Build the app once and it is ready for Android, iOS and Windows operating systems. TOKN also supports and works with other app development platforms.

2

### Integrate corporate data

TOKN has the framework and tools that make it easy to connect to multiple source systems. Select only the fields which you wish to use and build highly intuitive applications while reducing data consumption.

3

### Agile visualisation

Use TOKN to rapidly build your own high fidelity prototypes using a blend of open standards. Make use of TOKN specific features to enable device hardware capability, like scanning and signatures, which can then be incorporated into your application. Customise menus and screens to suite your organisations style guide.

4

## Targeted app deployment

TOKN has the framework and tools to automate the deployment of your applications and updates. Once the app is ready it can be in the users hands in minutes. Use simple drag drop functions to easily assign applications to users.
