

Simple Application Management

App lifecycle Management

As app delivery accelerates and the mobile ecosystem of an organisation begins to grow so does the level of complexity. Getting that application to the intended recipient needs to be a priority, but managing updates and security of data can soon become a nightmare. If it's too hard it won't get done. Managing enterprise mobility and the life cycle of multiple applications efficiently can eliminate manual application management processes and accelerate user adoption in your organisation.

The TOKN Enterprise Mobility Platform includes the necessary enterprise mobile application management tools to reduce the TCO and enhance the user experience.

1

Enhance app security

Includes TOKN's unique targeted app deployment feature. Controlled centrally, applications can be deployed to specific users and user groups. This allows granular control on deployment which accelerates beta testing.

2

Accelerate app delivery

The ability to control and automate app deployment speeds up the application delivery cycle. Users don't need to install applications themselves or have their devices provisioned.

3

Reduce device downtime

Applications can be deployed and updated remotely regardless of physical location of the device and without any user intervention.
